Technology & Research

Research Overview Document

Advancing Human Interface Systems Through Wearable Innovation

Thorbok Tech is a research and innovation entity focused on the development of advanced wearable interface systems, assistive technologies, and human-centered design solutions.

The company explores the intersection of smart textiles, accessibility, and interactive systems, with the goal of enhancing human capabilities, safety, and communication in real-world and extreme environments.

CORE RESEARCH AREAS

- Human-Computer Interaction (HCI)
- Wearable Interface Systems
- Smart Textiles & Responsive Materials
- Assistive Technology & Accessibility
- Human-Centered Design
- Future Human Interface Systems

Flagship Research Project

Luminous Braille Wearable Interface System

This research project introduces a novel wearable interface system integrating luminous braille technology into textile structures.

The system combines tactile braille interaction with light-emitting components, enabling both physical reading and visual signaling.

This dual-modality approach enhances accessibility, improves safety in low-visibility environments, and introduces new possibilities for human-to-human and human-environment communication.

Potential applications include assistive technology, smart wearable systems, emergency identification, and including aerospace environments, space missions, and extreme human-interface conditions.

Research Status

This project is currently under scientific dissemination and academic validation.

The research is being prepared for submission to international scientific platforms, including arXiv, and aims to contribute to the advancement of wearable interface systems and assistive technologies.

Publications & Research

• arXiv (submission in progress – endorsement pending)
• GitHub Repository
• Medium Article (public overview)

Scientific Approach

Thorbok Tech develops conceptual and forward-looking research frameworks based on:

• Human-centered design principles
• Interdisciplinary innovation
• Scalable wearable system architecture
• Real-world accessibility challenges

The objective is to bridge the gap between conceptual research and future applied technologies.

Future Research Directions

• Integration of responsive and intelligent textile materials
• Development of adaptive wearable communication systems

• Exploration of human-interface systems in extreme environments
• Applications in aerospace and space-related human systems

About the Founder

Mason Ewing is a designer, entrepreneur, and independent researcher specializing in wearable interface systems and inclusive innovation.

As a blind creator, his work is directly informed by real-world accessibility challenges, shaping a unique approach to human-centered technology design.
